

Writing better Git commit messages is crucial for maintaining a clean and understandable version history. To do this, start with a descriptive and concise one-line title that summarizes the change, using the imperative mood and proper capitalization. Aim for a title of around 50 characters or less. If needed, provide additional context and explanations in the commit message body, explaining why the change was made and how it addresses a specific problem. Keep lines in the body under 72 characters and organize them with bullet points or paragraphs for readability. If your commit relates to an issue or ticket, reference it in the message using "Fixes #123" or a similar format. Consistency in style and format across commit messages is essential, and always take a moment to review and edit your message before pushing your changes. Remember that these messages serve as documentation for your code and will be read by you and your team in the future, so making them informative and clear is vital for effective collaboration.
